# Nutrition in liver Transplantation: A central issue

**Prof. Hanan Soliman**

Tropical Medicine  
Tanta University

- Malnutrition is common in liver transplant candidates (20-80%) and increases the risk of mortality.
- Improving pre-transplant nutritional status improves the post transplant morbidity and mortality

# Our agenda

In the next 15 min. we will go through:

- malnutrition in pre transplant
- Nutritional assessment in pre transplant
- Nutritional requirements and support in pre transplant

# Why to find malnutrition in pre transplant?

# It is a complicated puzzle!

liver transplantation is indicated in end stage liver disease which commonly complicate chronic liver disease and cirrhosis

Added to the bad psychological state of the patient which affect eating, Cirrhosis has its package of anorexia, mal digestion, mal absorption, associated infections or neoplasm

- Anorexia
- Ascites
- Altered taste perception
- Metabolic and inflammatory derangements
- Inadequate diet restrictions
- Decreased social status
- Polypharmacy
- Multiple paracentesis
- Variceal bleeding
- Long fasting periods for labs and diagnostic procedures

# How to assess nutritional state in pre transplant patients

# **NUTRITIONAL ASSESSMENT**

- Nutritional assessment is essential for all patients in healthcare system
- It means to predict the person more liable to develop malnutrition, not to diagnose a malnourished patient

- Malnutrition reduced patient and graft survival, longer ventilator support, and extended length of stay.
- higher risk of post-operative infections have been found in studies of malnourished liver transplant patients compared to well- nourished patients.

## BMI

- Body mass index (BMI)  $<18.5$  kg/m<sup>2</sup> has been shown to be a predictor of death in two large studies of 73,500 and 38,194 liver transplant patients.

Orci LA, et al. (2013).; Dick AA, et al. (2009).

# sarcopenia

- sarcopenia (muscle depletion), in liver transplant patients is associated with poor outcomes and reduced survival.
- up to 45% of patients with cirrhosis are sarcopenic, including overweight and obese patients

Hamaguchi Y, et al. (2014).; Englesbe MJ, et al. (2010); Kaido T, et al. (2013).

# Obesity

- There is no absolute cut-off BMI for liver transplant but those with BMI  $>40$  kg/m<sup>2</sup> are likely to have increased post-transplant mortality.
- Surgical difficulties are correlated to waist circumference in morbidly obese patients.

Newsome PN, et al. (2012)

# Obesity

- Guidelines for NASH recommend all transplant candidates are nutritionally assessed by a dietitian, including handgrip strength, anthropometry measurements and subjective global assessment.

Newsome PN, et al. (2012)

# Body Weight

dry weight

	Ascites	Peripheral oedema
Minimal	2.2 kg	1.0 kg
Moderate	6.0 kg	5.0 kg
Severe	14.0 kg	10.0 kg

# Waist circumference

Not accurate in ascites

# Handgrip strength

- Poor handgrip strength has been found to be associated with longer length of stay post-liver transplant.

Vidas NA, et al. (2009)

# Arm anthropometry

- Monitoring mid-upper arm circumference (MUAC) and mid-arm muscle circumference (MAMC) if skinfold calipers are available.
- It is a cost-effective and simple method of monitoring changes in body mass.

# Subjective global assessment

## Subjective Global Assessment

### I. History

#### A. Weight

Height \_\_\_\_\_ Current weight \_\_\_\_\_

Pre-illness weight \_\_\_\_\_

Weight in past 6 months: High \_\_\_\_\_ Low \_\_\_\_\_

Overall change in past 6 months: \_\_\_\_\_

#### B. Appetite

Dietary intake change relative to normal

Appetite in past two weeks: \_\_\_\_\_ good \_\_\_\_\_ fair \_\_\_\_\_ poor

Early satiety: \_\_\_\_\_ none \_\_\_\_\_ 1-2 weeks \_\_\_\_\_ > 2 weeks

Taste changes: \_\_\_\_\_ none \_\_\_\_\_ 1-2 weeks \_\_\_\_\_ > 2 weeks

#### C. Current intake per recall

Calories \_\_\_\_\_ Protein \_\_\_\_\_

Calories needs \_\_\_\_\_ Protein needs \_\_\_\_\_

# Subjective global assessment

Calories needed \_\_\_\_\_ Total needs \_\_\_\_\_

## D. Persistent gastrointestinal symptoms

Nausea: \_\_\_\_\_ none \_\_\_\_\_ 1-2 weeks \_\_\_\_\_ > 2 weeks

Vomiting: \_\_\_\_\_ none \_\_\_\_\_ 1-2 weeks \_\_\_\_\_ > 2 weeks

Diarrhea (loose stools, > 3/day)

Number of stools per day \_\_\_\_\_ / Consistency \_\_\_\_\_

\_\_\_\_\_ none \_\_\_\_\_ 1 weeks \_\_\_\_\_ > 1 weeks

Constipation: \_\_\_\_\_ none \_\_\_\_\_ 1-2 weeks \_\_\_\_\_ > 2 weeks

Difficulty chewing: \_\_\_\_\_ none \_\_\_\_\_ 1-2 weeks \_\_\_\_\_ > 2 weeks

Difficulty swallowing: \_\_\_\_\_ none \_\_\_\_\_ 1-2 weeks \_\_\_\_\_ > 2 weeks

## E. Functional capacity

\_\_\_\_\_ No dysfunction \_\_\_\_\_ Dysfunction

\_\_\_\_\_ weeks

\_\_\_\_\_ working suboptimally

\_\_\_\_\_ ambulatory

\_\_\_\_\_ bedridden

# Subjective global assessment

## II. Physical exam

### A. Status of subcutaneous fat (triceps, chest)

\_\_\_\_\_ good stores \_\_\_\_\_ fair stores \_\_\_\_\_ poor stores

### B. Muscle wasting (quadriceps, deltoids, shoulders)

\_\_\_\_\_ none \_\_\_\_\_ mild to moderate \_\_\_\_\_ severe

### C. Edema and ascites

\_\_\_\_\_ none \_\_\_\_\_ mild to moderate \_\_\_\_\_ severe

## III. Existing conditions

### A. Encephalopathy

\_\_\_\_\_ none \_\_\_\_\_ stage I-II \_\_\_\_\_ stage III \_\_\_\_\_ stage IV

### B. Chronic or recurrent infection

\_\_\_\_\_ none \_\_\_\_\_ 1 week \_\_\_\_\_ > 1 week

### C. Kidney function

\_\_\_\_\_ good/ \_\_\_\_\_ decreased (no dialysis)/ \_\_\_\_\_ decreased (with dialysis)

### D. Varices

\_\_\_\_\_ none/ \_\_\_\_\_ varices (no bleeds)/ \_\_\_\_\_ varices (with bleeds)

## IV. Subjective Global Assessment Rating (based on sections I, II, III)

# Subjective global assessment

## II. Physical exam

### A. Status of subcutaneous fat (triceps, chest)

\_\_\_\_\_ good stores \_\_\_\_\_ fair stores \_\_\_\_\_ poor stores

### B. Muscle wasting (quadriceps, deltoids, shoulders)

\_\_\_\_\_ none \_\_\_\_\_ mild to moderate \_\_\_\_\_ severe

### C. Edema and ascites

\_\_\_\_\_ none \_\_\_\_\_ mild to moderate \_\_\_\_\_ severe

## III. Existing conditions

### A. Encephalopathy

\_\_\_\_\_ none \_\_\_\_\_ stage I-II \_\_\_\_\_ stage III \_\_\_\_\_ stage IV

### B. Chronic or recurrent infection

\_\_\_\_\_ none \_\_\_\_\_ 1 week \_\_\_\_\_ > 1 week

### C. Kidney function

\_\_\_\_\_ good/ \_\_\_\_\_ decreased (no dialysis)/ \_\_\_\_\_ decreased (with dialysis)

### D. Varices

\_\_\_\_\_ none/ \_\_\_\_\_ varices (no bleeds)/ \_\_\_\_\_ varices (with bleeds)

## IV. Subjective Global Assessment Rating (based on sections I, II, III)

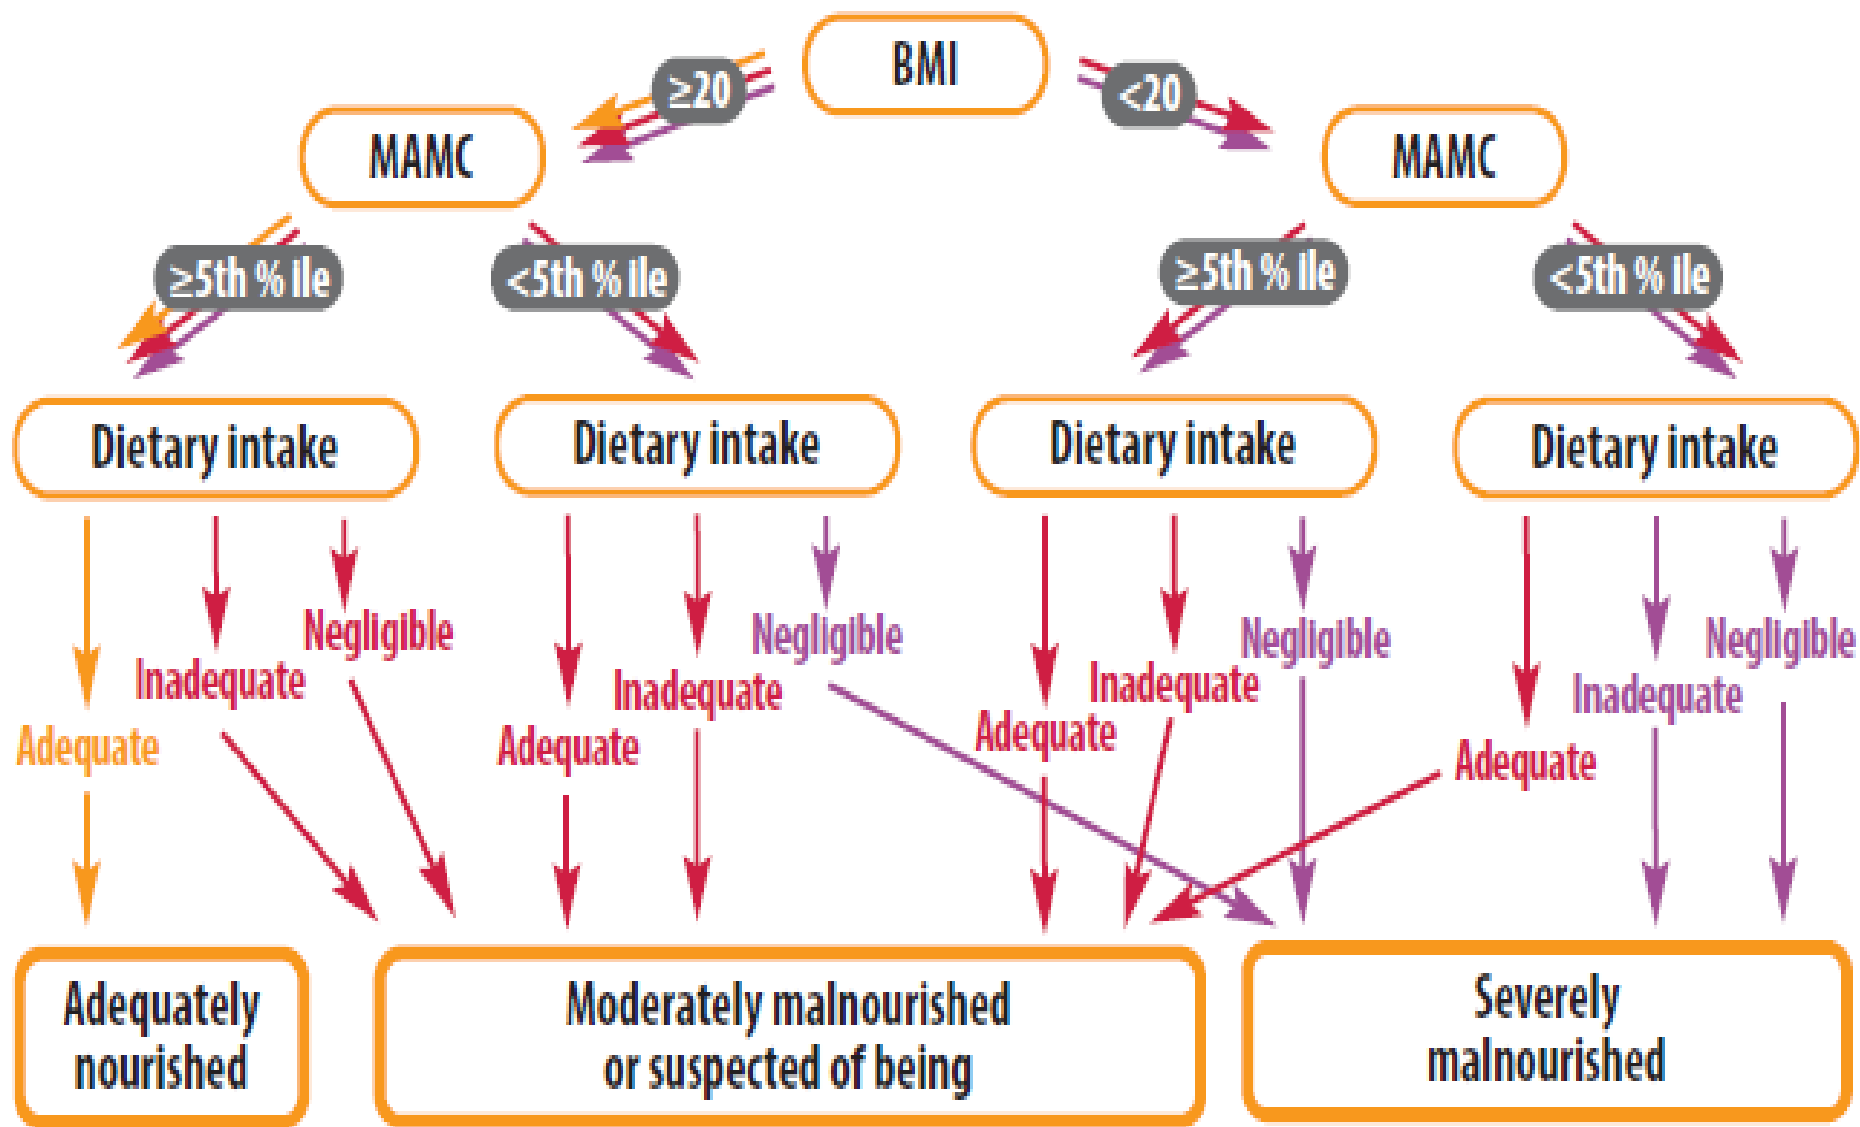

# Subjective Global Assessment

## IV. Subjective Global Assessment Rating (based on sections I, II, III)

A. \_\_\_\_\_ Well nourished

B. \_\_\_\_\_ Moderately malnourished (or suspected of being malnourished)

C. \_\_\_\_\_ Severely malnourished

Subjective Override

Spilman (2015)

# What are the caloric requirements In Pre transplant Patients?

# Energy and Protein Requirements for Liver Disease

	Kcal/kg/day	Henry BMR with activity and stress factors (SF)	Protein(g)/kg/day
<b>Decompensated</b>	35-40	SF 30-40%	1.2-1.5
<b>Repletion</b>	Calculate requirements as above + 400-1000 kcal	Calculate requirements as above + 400-1000 kcal	1.5-2

Anastácio,2016

# Decompensated cirrhosis and protein

# TIPS, Encephalopathy and protein

## GREEN VEGETABLES

## OTHER COLOURFUL VEGETABLES

## LEGUMES

## WHOLE GRAINS

## CALCIUM-RICH FOODS

## FRUIT

# What Is The Optimal Diet In Pre transplant Patients?

# The eatwell plate

Use the eatwell plate to help you get the balance right. It shows how much of what you eat should come from each food group.

**Fruit and  
vegetables**

**Bread, rice,  
potatoes, pasta  
and other starchy foods**

**Meat, fish,  
eggs, beans  
and other non-dairy  
sources of protein**

**Milk and  
dairy foods**

**Foods and drinks  
high in fat and/or sugar**

# Decompensated cirrhosis and fasting

# Consider NG feeding

Enteral is better than parenteral

# Micro nutrient

# Consider supplementation

If specific deficiency diagnosed

# Ascetic patient and sodium

The sodium content of enteral feed is usually within the no added salt recommendation.

# Carry Home Message

# Carry home message

- The cause of malnutrition in patients with cirrhosis is multifactorial, please do not add iatrogenic.
- avoid unnecessary food restriction and modify according to individual tolerance
- Subjective global assessment , muscle mass, and Hand grip is extremely beneficial.

# Carry home message

- Bed time snack is a must in decompensated cirrhosis
- Avoid prolonged fasting
- Patient listed for transplantation should Not Fast In Ramadan

A vibrant wreath of fresh fruits and vegetables is arranged on a rustic wooden background. The wreath includes a yellow bell pepper, a red bell pepper, radishes, green grapes, strawberries, a green cucumber, a banana, a pineapple, a red apple, a bunch of carrots, and various leafy greens. The word "Thanks" is written in white, bold, sans-serif font across the center of the wreath.

Thanks
